Familiarizing yourself with these names will empower you to make informed decisions.

**Remember these can change at any time. "So Listen Up!" Our kids have learned these names and so can you.**

PCP was first developed in the 1950s as an anesthetic but due to bad side effects like: hallucinations, delirium, and mania it could no longer be approved for human medical use. It was discontinued in the 1960s by the pharmaceutical company that created it.

### **There are different types of PCP**

PCP is illegally manufactured in labs and sold in the form of tablets, capsules, colored powders and in a liquid form. In this form the drug is known as wet.

Below are some examples of what the drug could look like.

**Powder Form**

**Capsule Form**

**Pill Form**

**Liquid form**

### **How long does a PCP high last?**

It will vary depending on how you get it in your system and it also depends on the person. The average PCP high can last anywhere from 11-52 hours.

### **Different doses bring different effects.**

**Low Dose:** A low dose can give a person the feeling of euphoria, relaxation, numbness, anxiety, confusion, amnesia and blurry vision. It can also cause the person to stare aimlessly.

**Medium Dose:** A medium dose can cause a person to have: Confusion, Paranoia, Fever, Delusions and Schizophrenic like behavior.

**High Dose:** A high dose can cause the most dangerous effects. This could include: Fever, Respiratory Failure, Coma, Seizures and even Death.

### **Withdrawal Symptoms**

Withdrawal symptoms from PCP are very dangerous and need monitoring by a medically trained professional.

**These symptoms could include:**

Speech difficulty, Depression, Memory loss, Weight loss, Confusion, Lack of impulse control, Anxiety, Coma, Suicide Attempts and Death.
